Abstract

Present study was under taken to see the mechanism of preventing the excessive and irregular uterine bleeding in the experimental model for providing the basis for clinical efficacy of test preparations. The test preparations were studied for estrogenic, anti inflammatory, anti spasmodic effects and to assess the influence on bleeding and clotting time in Charles Foster strain albino rats.

From the detailed analysis of the data obtained during the present study, it is observed that Madhukadi Vati and Sarivadi Vati both have anti estrogenic, anti inflammatory and bleeding & clotting time modulating effects. But Madhukadi Vati has more anti- spasmodic effect while Sarivadi Vati has more spasmodic effect/oxytocic effect.
