

## Chemical Analysis of Induced Mutants of Fenugreek Oil and Diosgenin Content

B.S. Dixit<sup>1</sup>, S.N. Srivastava<sup>2</sup>, V. Laxmi<sup>3</sup> and M.N. Gupta<sup>4</sup>

Received on March 16th, 1984

*Results were obtained after analysis of oils and diosgenin content in seeds of different mutants and control plants of fenugreek with a view to isolate desirable mutants having either higher oil and/or diosgenin content. The oil and diosgenin contents varied from 5.3 to 7.9 and 0.28 to 0.74 percent respectively in different mutants as compared to control.*
